

## Week 5 Comments

Good job using a good variable name instead of just `i` for your counter.

Great indentation!

Very good looking code!

Good job handling the partial line condition!

Good to declare a constant!

Good job with the end of line logic!

Consistent indentation will make your code easier to read and understand, and helps to find errors before they become a problem.

Good commenting and documentation of your code!

Using tabs for formatting is usually not a good idea. The problem is you don't have control over how each user's environment handles tabs. It's always better to format with space characters.

The assignment indicated that numbers needed to be both divisible by 5 AND by 6.

There was an announcement made at the beginning of the week that there should not be a blank space at the end of the line. What logic could you add here to only print the space if it's not the end of the line?

`%3.1f` means you intend the number to take a total of 3 characters. So you really need to make this `%5.1f` to handle a number with 3 digits before the decimal and 1 digit after the decimal.
